AUTHOR: Yakubov, T.F., Doctor of Agricultural Sciences 25-7-17/51  
TITLE: Light Soils and Their Protection (Legkiye pochvy i ikh zashchita)  
PERIODICAL: Nauka i Zhizn', 1957, # 7, p 17-18 (USSR)

ABSTRACT: Protection of light soil from wind erosion in recently cultivated virgin soil areas in northern Kazakhstan, Siberia, and Altay is a problem that occupies agricultural researchers. As light soil dries quickly and is easily blown off by the wind, the entire crop or part of it may be lost, since the soil then loses most of the nourishing substances needed by the plants. When such soil is properly cultivated and protected, crops are very satisfactory. Various methods have been applied to stop wind erosion. Important is a rational distribution of the grounds (plowland, meadows, forests); and mechanical cultivation should be performed when the soil is moist to avoid clouds of dust. Experiments with rows of high stemmed plants (corn, sunflower, mustard) used as partitions between other crops give very satisfactory results. The best protection was achieved with wooded belts between fields. If correctly arranged, they protect the soil from winds and the crops from drifting sand and accumulating snow in winter. They also pro-

TITLE: Effect of the elastic twist of the wing<sup>78</sup> on certain characteristics of the longitudinal stability and the steerability of a glider

SOURCE: IVUZ. Avitsionnaya tekhnika, no. 4, 1965, 84-89

TOPIC TAGS: aeronautic theory, glider

ABSTRACT: The basic assumptions for the mathematical treatment were:  
1) the wing is made up of identical profiles; 2) the sweepback of the wing is negligibly small; 3) the centers of rigidity of all the sections of the wing lie on a line of equal percentages; 4) the wing is set in the plane of symmetry of the glider; 5) the region of small deformations is considered; 6) the linear region of the relationship  $C_y = f(x)$  is considered; the distribution of the circulation over the span of a flat wing is assumed to be elliptical; 8) the effect of a change in the resistance of a wing due to twisting on the longitudinal moment of a glider is negligibly small; 9) the change in the angle of attack of the

Card 1/2

L 45109-66

ACC NR: AP6003186

fuselage due to elastic twisting of the wing on the longitudinal moment is negligibly small. The author determines mathematically the dependence of the angle of twist of the end section of a wing on the velocity head and the lifting force coefficient, and the measure of the longitudinal statistical stability with respect to the overload and the velocity. The calculated results are compared with flight data. It is concluded that: elastic twisting of the wing decreases the longitudinal moment and the balance angles of the rudder deviation by amounts proportional to  $q$ ; 2) the values of the longitudinal statistical stability with respect to the overload and the velocity also decrease; 3) the forces on the control stick for the rudder height in steady flight decrease with a rise in velocity. TITLE: Construction of tunnels in soils with high hydrostatic pressure

SOURCE: Transportnoye stroitel'stvo, no. 11, 1965, 17-19

TOPIC TAGS: railway tunnel, construction, hydrostatic pressure

ABSTRACT: Part of the Baku subway system had to be passed through fine-grained sandy loam with underground water pressure of over 4 atm. Experiments showed that continuous out-pumping could lower the water table somewhat in the area of the operations. After analysing several plans, it was decided that 43 wells would be dug, 27 in an outer ring, 16 in an inner ring, to lower the water pressure in the work area; as the tunnel was dug under compressed air, the wells were systematically checked and freed of filtered air. The pressure in the work tunnels was 1.5-1.7 atm. Orig. art. has 4 figures.

"Contribution to the Hydrobiology of Lake Sartlan," Zimetki po Faune i Flore Sibiri, No 17, 61-66, 1953

A report in a symposium published by the Tomsk University Press, Tomsk. In 1946 and 1948, some data on the biology of Lake Sartlanchik and on the small Karapuz River (in the region of Lake Sartlan, Novosibirsk Oblast) was collected relating to water reservoirs, chemical composition of the water, flowering plants, and composition of the phytoplankton.

In 1946, the phytoplankton of Sartlanchik was poor in quality but rich in quantity. Predominating were green algae; more weakly developing were blue-green algae. The diatomaceous algae were exclusively bottom and littoral forms. In 1948, the blue-green algae predominated. The quantity of organisms per liter reached 130,800; here, up to 30% were due to bottom and littoral diatoms. The summer phytoplankton of the Karapuz River, both in 1946 and 1948, was poor in quality and quantity and was represented mainly by diatoms. The number of plant organisms per liter did not exceed 21,635. (RZhGeol, No 1, 1955)

Title : The Cancerostatic Action of 6-Azauracil.

Orig Pub: Chemotherapeutika, 1. Farmac. sympos, Praha, 1956, 29.

Abstract: For a period of 6 days 5 mg doses of 6-azauracil were injected in mice, beginning within 24 hours after intraperitoneal grafting with the ascitic cancer of Ehrlich. Comparative simultaneous studies, under identical conditions, were made with 6- mercaptopurine. Judging from the survival rate of the animals, both preparations inhibited the growth of the tumor to the same degree.

1860. EFFECT OF FACTORS FROM EXTRACTS OF NEOPLASTIC TISSUES  
CONTAINING LOOSELY BOUND SULPHUR ON TUMOUR DEVELOPMENT  
AND LIVER CATALASE ACTIVITY IN THE HOST (Russian text) - Šorm  
F. and Yakubovic A. Biochem. Dept., Chem. Inst., Czechoslovak  
Acad. of Scis, Prague - BIOKHIMIYA 1957, 22/5 (849-854) Tables 5 Illus. 2

The content of loosely-bound S in extracts from neoplastic tissues is several times greater than that in similarly obtained extracts from normal or embryonic tissue. It is concluded from experimental evidence that the factors containing loosely-bound S reduce the activity of liver catalase of the host inoculated with the malignant tumour and that they are closely related or identical to one of the so-called 'accelerating' factors which speed up the malignant process. A drop in activity of liver catalase in healthy animals and an acceleration of the malignant process have also been noted upon administration of elementary S. (II, 5, 16)

TITLE: Thermo-radiation cracking of propane

SOURCE: Neftekhimiya, v. 3, no. 4, 1963, 615-619

TOPIC TAGS: propane cracking, thermo-radiation cracking, propane, thermal cracking, ionized irradiation

ABSTRACT: Authors studied thermo-radiation cracking of propane, which is a much lighter hydrocarbon and which is used as an industrial raw material. The experiments were conducted at temperatures between 500 and 700°C. Propane gives a fairly good conversion and a comparatively simple composition of gaseous products when an intensive radiation dose is applied during the thermal-radiation process, as well as during thermal cracking. The results of thermo-radiation cracking of propane and their comparison to thermal cracking under the same conditions are presented. The yields of H<sub>2</sub>, CH<sub>4</sub>, C<sub>2</sub>H<sub>6</sub> and C<sub>3</sub>H<sub>8</sub> as a

Card 1/2

L 15478-63

ACCESSION NR: AP3005459

function of temperature are also given. The activation energy of the propane thermo-radiation cracking process is close to the activation energy of the chain propagation during thermal cracking. The application of ionized irradiation for the initiation of chain reaction permits the carrying-out of the propane cracking process at temperatures which are 100°C below ordinary thermal cracking and with good conversion. The experimental and chemical yields under the conducted experimental conditions were approximately  $10^3$  molecules per 100 ev. Orig. art. has: 5 figures and 3 tables.
